P2

https://shopify.dev/docs/apps/build/product-merchandising/bundles/add-product-fixed-bundle

Shopify Update

Shopify added support to **combine bundle options via Admin API**.

Bundle Opportunity

Bundles can now behave like **configurable products**.

Example:

Laptop bundle:

Choose:

- RAM
- Storage
- Color
- Warranty

Wolfpack Feature

Configurable Bundle Builder

Merchant defines:

Bundle = Laptop Kit

Option 1 → RAM
Option 2 → Storage
Option 3 → Warranty
Option 4 → Accessories

Inventory gets synced via Shopify from fixed bundle created via wolfpack

4. AI Commerce Discovery (Bundles in AI Chats)

Shopify Update

Products can appear in **AI shopping chats like ChatGPT and Copilot**.

Bundle Opportunity

Bundles can become **AI-recommended products**.

Example user prompt:

Best skincare routine under $100

AI could recommend a **Skincare Routine Bundle**.

Wolfpack Feature

AI-Ready Bundles

Wolfpack automatically:

- Structures bundle metadata
- Sends bundle SKUs to Shopify catalog
- Optimizes bundle titles for AI discovery

Merchant Benefit

Bundles become **AI search optimized products**.

P1

🐺 Wolfpack — Ad-Ready Bundle Infrastructure

Developer Architecture Documentation

Overview

Wolfpack enables Shopify merchants to create **bundles that can be advertised across marketing channels** like:

- Google Shopping
- Meta Ads
- TikTok Ads

Unlike most bundle apps that create **virtual bundles**, Wolfpack creates **real Shopify products** for bundles.

Because these bundles are real products, they can appear in:

- Catalog feeds
- Shopping ads
- Retargeting campaigns

Core Principle

Wolfpack **does NOT integrate directly with ad platforms**.

Instead it relies on **Shopify's existing sales channel ecosystem**.

Flow:

Merchant creates bundle in Wolfpack
↓
Wolfpack creates bundle product in Shopify
↓
Bundle product published to selected sales channels

↓
Shopify channel apps sync product to ad platforms

Ad platforms receive bundle data automatically.

This keeps the system:

- simpler
- compliant
- future-proof

Example Bundle

Merchant sells coffee products.

Individual products:

Product	Price
Coffee Beans	$25
Coffee Mug	$15
Coffee Grinder	$35

Merchant creates bundle in Wolfpack.

Bundle:

Home Barista Starter Kit
Price: $49

Bundle includes:

- Coffee Beans
- Coffee Mug
- Coffee Grinder

What Wolfpack Creates

Wolfpack creates a **bundle product in Shopify**.

Example product:

Title: Home Barista Starter Kit
SKU: bundle-barista-kit
Price: $49
URL: /products/home-barista-starter-kit
Product Type: Bundle

This product behaves like a **normal Shopify product**.

Bundle Feed Example

Once synced to feeds, it looks like a normal product.

Example feed item:

id: bundle-barista-kit
title: Home Barista Starter Kit
price: $49
availability: in_stock
link: /products/home-barista-starter-kit

Ad platforms can now:

- show the bundle
- track conversions
- optimize ads

System Architecture

Wolfpack consists of **four major systems**.

1️⃣ Bundle Creation Engine
2️⃣ Channel Publication Controller
3️⃣ Inventory Calculation Engine
4️⃣ Campaign Bundle System

1️⃣ Bundle Creation Engine

When a merchant creates a bundle, Wolfpack must create a **parent bundle product** in Shopify.

Example:

POST → Shopify Admin API
Create Product

Fields:

Field	Value
title	Bundle name
productType	Bundle
status	Active
variants	Single variant

Example result:

product_id = 945284834

Wolfpack stores:

bundle_id
shopify_product_id
component_products
bundle_price

Developer Reference

Admin API documentation from Shopify

Product creation:

https://shopify.dev/docs/api/admin-graphql/latest/mutations/productCreate

---

2️⃣ Channel Publication Controller

Wolfpack allows merchants to choose which channels the bundle appears in.

Example UI:

Channel	Enabled
Google	ON
Meta	ON
TikTok	OFF

Wolfpack publishes or removes the product from sales channels.

Developer Flow

Merchant toggles channel
↓
Wolfpack calls Shopify publication API
↓
Product published/unpublished

API:

productPublicationCreate
productPublicationDelete

Developer Reference

Publication APIs:

https://shopify.dev/docs/api/admin-graphql/latest/mutations/productpublicationcreate

https://shopify.dev/docs/api/admin-graphql/latest/mutations/productpublicationdelete

---

3 Inventory Calculation Engine

Bundles depend on component inventory.

Example:

Product	Stock
Coffee Beans	50
Coffee Mug	20
Coffee Grinder	10

Bundle stock must equal the **lowest component stock**.

Formula:

bundle_stock = MIN(component_inventory)

Result:

bundle_stock = 10

Wolfpack updates bundle inventory automatically.

Trigger Events

Inventory recalculation occurs when:

- component product inventory changes
- bundle is purchased
- component product is restocked

Developer Reference

Inventory APIs:

https://shopify.dev/docs/api/admin-graphql/latest/mutations/inventoryadjustquantity

---

4 Campaign Bundle System

Some bundles are used **only for advertising campaigns**.

Example:

- TikTok promotion
- Influencer bundle
- Holiday sale

These bundles should **not appear in the storefront catalog**.

Wolfpack uses **Unlisted products**.

Example

Bundle:

TikTok Coffee Starter Bundle

Product page:

/products/tiktok-coffee-bundle

Customer journey:

TikTok Ad
↓
Landing bundle page
↓
Checkout

Bundle is not visible in:

- collections
- search
- store navigation

Developer Reference

Unlisted product status introduced in **Shopify Winter ’26 Edition**

Documentation:

https://shopify.dev/docs/apps/build/online-store/product-unlisted-status

Behavior:

Unlisted products:

- hidden from search
- hidden from collections
- excluded from sitemap
- accessible via direct URL

Channel Sync Architecture — Meaning

Text:

> Wolfpack does not push products to ad platforms directly.
> Instead Shopify channel apps do the syncing.

Meaning in simple terms:
Wolfpack **doesn’t talk to Google, Meta, or TikTok APIs directly**. Instead:

- Wolfpack creates and manages the bundle as a **real Shopify product**.
- Shopify has built-in **sales channel apps** that handle syncing to Google, Meta, and TikTok automatically.
- Wolfpack only manages the **bundle creation, inventory, and publication** to the correct channels inside Shopify.

Why it’s important:

- You **avoid building and maintaining custom integrations** with multiple ad platforms (time-consuming, error-prone).
- Updates to channels (e.g., new Google feed rules) are handled by Shopify, not Wolfpack.
- Keeps Wolfpack **simpler, scalable, and compliant**.

Technical Doc References:

Channel	Shopify App Documentation
Google Shopping	Google & YouTube Shopify App: https://help.shopify.com/en/manual/promoting-marketing/google
Meta (Facebook/Instagram)	Facebook & Instagram Shopify App: https://help.shopify.com/en/manual/promoting-marketing/facebook
TikTok	TikTok Shopify App: https://help.shopify.com/en/manual/promoting-marketing/tiktok

---

2️⃣ Full System Flow — Meaning

Text:

Merchant creates bundle

↓

Wolfpack creates bundle product

↓

Bundle product published to sales channels

↓

Shopify channel apps sync product to ad platforms

↓

Customer clicks ad

↓

Bundle product page

↓

Checkout

Meaning in simple terms:

1. Merchant creates a bundle in Wolfpack (e.g., Coffee Starter Kit).
2. Wolfpack creates a **real Shopify product** for that bundle.
3. Wolfpack publishes it to the selected **sales channels** (Google, Meta, TikTok).
4. Shopify **channel apps automatically sync** the product data to the ad platforms (price, images, availability).
5. Customer sees the ad and clicks → goes to the **bundle product page** → purchases it.

Why it matters:

- Ensures **ads match the product page** exactly.
- Avoids **inventory or price mismatches** between the ad and store.
- Works with Shopify's **native infrastructure**, so it's more reliable.

Technical Doc References:

- Shopify Product Publication API:
  https://shopify.dev/docs/api/admin-graphql/latest/mutations/productpublicationcreate
  https://shopify.dev/docs/api/admin-graphql/latest/mutations/productpublicationdelete
- Shopify Sales Channel Apps Docs (see above)

3️⃣ Why This Architecture Is Important — Meaning

Text:

> This approach avoids major engineering risks.
> Wolfpack does NOT need to maintain integrations with Google, Meta, TikTok.
> Instead it leverages Shopify infrastructure.

Meaning in simple terms:

- Wolfpack **stays inside Shopify ecosystem**, avoiding fragile direct integrations.
- Reduces developer work, maintenance, and API breakage risk.
- Scales easily across stores because Shopify handles syncing.

Technical Doc References:

- Shopify Sales Channels Overview:
  https://shopify.dev/docs/apps/sales-channels

4️⃣ Merchant Value — Meaning

Merchants can:

- Advertise bundles **directly** (no custom work needed).
- Track **bundle ROAS** via Google/Meta analytics.
- Scale advertising campaigns for bundles.
- Run **campaign-specific bundles** (hidden or limited bundles for ads).

Technical Implementation References:

- Bundle creation → Shopify Product API:
  https://shopify.dev/docs/api/admin-graphql/latest/mutations/productCreate
- Unlisted product status (for campaign bundles):
  https://shopify.dev/docs/apps/build/online-store/product-unlisted-status
- Channel sync via sales channel apps (Google, Meta, TikTok): see above.

✅ **Summary in 1 line:**
Wolfpack creates **real products**, publishes them to **Shopify sales channels**, and Shopify handles the ad sync — making bundles **ad-ready without custom API integrations**.

Simple Concept Summary

Most bundle apps:

Virtual bundles
↓

Not visible in ads

Wolfpack:

Real bundle products
↓
Sync to catalog feeds
↓
Appear in ads

Future Expansion (Optional)

Later versions could include:

- bundle performance analytics
- channel-specific bundle pricing
- feed optimization
- automated campaign bundles

If you're building **Wolfpack seriously**, the next thing I can show you is something extremely valuable:

“The one architecture mistake that breaks 95% of Shopify bundle apps when merchants run Google Shopping ads.”

Fixing this early can **save months of engineering rework.**

Final Ad ready + Campaign bundles

I kept the language **very simple**, included **one full bundle example from creation → publishing → ads → attribution**, and aligned it with **Shopify's sales channel model**.

🐺 Wolfpack — Ad-Ready Bundle Infrastructure

Product + Engineering Documentation

This document explains how Wolfpack enables Shopify merchants to:

- Create **bundle products**
- Publish them through **Shopify sales channels**
- Run **ads for bundles**
- Track **which ad campaigns sell bundles**

Supported advertising platforms:

- Google Shopping / Ads
- Meta Platforms Ads (Facebook / Instagram)
- TikTok Ads

---

1. The Problem With Most Bundle Apps

Most Shopify bundle apps create **virtual bundles**.

Example flow used by many apps:

Customer visits store
↓
Adds multiple products
↓
App applies bundle discount in cart
↓
Checkout combines products

Problem:

The bundle **does not exist as a real product**.

Because of this:

- It **does not appear in product feeds**
- It **cannot be used in ads**
- It **cannot appear in ad catalogs**

Advertising platforms require **real catalog products**.

Example required fields for ads:

Field	Example
id	bundle-barista-kit
title	Home Barista Starter Kit
price	$49
availability	in_stock
link	product URL

Google product feed documentation:
https://support.google.com/merchants/answer/7052112

---

2. Wolfpack Solution

Wolfpack creates **real Shopify products for bundles**.

Because bundles are real products, they can:

- appear in product feeds
- appear in ad catalogs
- be used in shopping ads
- be used in retargeting ads

Wolfpack **does not connect directly to ad platforms**.

Instead it relies on **Shopify sales channels**.

Shopify handles syncing products to ad platforms.

Shopify sales channels documentation:
https://shopify.dev/docs/apps/sales-channels

---

3. High Level System Flow

Merchant creates bundle in Wolfpack
↓
Wolfpack creates bundle product in Shopify
↓
Bundle appears in Shopify product catalog
↓
Merchant publishes product to sales channels
↓
Shopify channel apps sync bundle to ad platforms
↓
Customer sees bundle advertisement
↓
Customer visits bundle product page
↓
Customer purchases bundle

---

4. Example Bundle (Simple)

The merchant sells coffee products.

Individual products:

Product	Price
Coffee Beans	$25
Coffee Mug	$15
Coffee Grinder	$35

Merchant creates bundle:

Home Barista Starter Kit

Bundle price:

$49

Bundle includes:

- Coffee Beans
- Coffee Mug
- Coffee Grinder

---

5. What Wolfpack Creates in Shopify

Wolfpack creates a **normal Shopify product**.

Example bundle product:

Field	Value
Title	Home Barista Starter Kit
SKU	bundle-barista-kit
Price	$49
Product Type	Bundle
URL	/products/home-barista-starter-kit

This product behaves exactly like a **normal product in Shopify**.

Shopify product API documentation:
https://shopify.dev/docs/api/admin-graphql/latest/mutations/productCreate

---

6. Publishing Bundles to Advertising Channels

Wolfpack **does not manage channel toggles**.

Publishing happens **inside Shopify**.

Example:

The merchant opens the bundle product in Shopify.

Then selects where to publish:

- Online Store
- Google channel
- Meta Platforms channel
- TikTok channel

Shopify then syncs product data automatically.

Shopify channel documentation:

Google
https://help.shopify.com/en/manual/promoting-marketing/google

Meta
https://help.shopify.com/en/manual/promoting-marketing/facebook

TikTok
https://help.shopify.com/en/manual/promoting-marketing/tiktok

---

7. Example Feed Item

After publishing, the bundle appears in feeds like this:

id: bundle-barista-kit
title: Home Barista Starter Kit
price: $49
availability: in_stock
link: /products/home-barista-starter-kit

Ad platforms now treat the bundle like a **normal product**.

---

8. Wolfpack System Architecture

Wolfpack contains four main systems:

1. Bundle Creation Engine
2. Inventory Calculation Engine
3. Campaign Bundle System
4. Feed Optimization System

---

9. Bundle Creation Engine

Purpose:

Create bundle products in Shopify.

Wolfpack calls the Shopify Admin GraphQL API.

Mutation used:

productCreate

Documentation:
https://shopify.dev/docs/api/admin-graphql/latest/mutations/productCreate

Wolfpack stores:

bundle_id
shopify_product_id
component_products
bundle_price

---

10. Inventory Calculation Engine

Bundle inventory depends on component inventory.

Formula:

bundle_stock = MIN(component_inventory)

Example inventory:

Product	Stock
Coffee Beans	50
Coffee Mug	20
Coffee Grinder	10

Bundle inventory:

10

Meaning:

Only **10 bundles can be sold**.

Inventory API documentation:
https://shopify.dev/docs/api/admin-graphql/latest/mutations/inventoryadjustquantity

---

11. Campaign Bundle System

Some bundles exist **only for advertising campaigns**.

Example:

- influencer bundle
- TikTok promotion
- holiday bundle

These bundles should not appear in the store catalog.

Shopify supports **Unlisted Products**.

Documentation:
https://shopify.dev/docs/apps/build/online-store/product-unlisted-status

Unlisted products:

- hidden from search
- hidden from collections
- hidden from sitemap
- accessible via direct URL

Example:

/products/tiktok-coffee-bundle

Customer flow:

TikTok Ad
↓
Bundle Landing Page
↓
Checkout

---

12. Feed Optimization System

Most bundle apps **do not optimize bundles for product feeds**.

Wolfpack improves feed performance.

Optimization areas:

Optimized Bundle Titles

Example:

Bad title:

Bundle #123

Better title:

Home Barista Starter Kit – Beans + Grinder + Mug

Better titles improve search relevance.

Bundle Description Optimization

Example description:

Perfect starter bundle for home coffee brewing.
Includes premium beans, grinder, and ceramic mug.

Bundle Images

Wolfpack can generate bundle images showing all products.

Example:

Beans + Grinder + Mug

Better images improve:

- click-through rate
- ad engagement

---

13. Ad Attribution for Bundles

Wolfpack tracks **which ads generate bundle sales**.

Supported platforms:

- Google Ads
- Meta Platforms Ads
- TikTok Ads

---

14. How Ad Platforms Pass Tracking Data

Ad platforms attach **UTM parameters** to URLs.

Example ad URL:

https://store.com/products/home-barista-starter-kit
?utm_source=google
&utm_medium=cpc
&utm_campaign=coffee_bundle_ads

Parameters explain where the customer came from.

Parameter	Meaning
utm_source	traffic source
utm_medium	ad type
utm_campaign	campaign name

---

15. Attribution Tracking Flow

Ad campaign
↓
Customer clicks bundle ad
↓
Customer lands on bundle page
↓
UTM parameters captured
↓
Session stored
↓
Customer purchases bundle
↓
Shopify creates order
↓
Wolfpack matches order with session
↓
Attribution recorded

---

16. Example Attribution Record

bundle_id: barista_kit
order_id: 8329472
utm_source: google
utm_campaign: coffee_bundle_ads
revenue: $49

---

17. Bundle Attribution Dashboard

Wolfpack can show merchants analytics like:

Bundle Revenue by Platform

Platform	Revenue
Google	$3,200
Meta Platforms	$1,500
TikTok	$700

Bundle Revenue by Campaign

Campaign	Revenue
coffee_bundle_ads	$2,000
holiday_gift_bundle	$1,400

---

18. Data Model

Example database tables.

Bundles table

bundle_id
shop_id
shopify_product_id
bundle_price
created_at

Bundle components

bundle_component_id
bundle_id
product_id
variant_id
quantity

Attribution table

attribution_id
bundle_id
order_id
utm_source
utm_medium
utm_campaign
revenue
created_at

---

19. Final Architecture Diagram

Wolfpack App
↓
Creates bundle product
↓
Shopify Product Catalog
↓
Merchant publishes to sales channels
↓
Shopify Channel Apps

↓
Ad Platform Catalogs
↓
Ads on Google / Meta / TikTok
↓
Customer purchases bundle
↓
Wolfpack records attribution

Final Summary

Wolfpack enables merchants to:

- create **real bundle products**
- publish bundles through **Shopify sales channels**
- advertise bundles on
    - Google
    - Meta Platforms
    - TikTok
- track **which campaigns generate bundle sales**

This makes Wolfpack not just a bundle app, but **bundle infrastructure for advertising**.

What Merchant flow would look like - non tech part

Below is the **same Wolfpack flow rewritten from a merchant's perspective** — meaning **what a merchant actually sees inside the Wolfpack app and Shopify**, with **no technical APIs or architecture**.

I'll use the **same coffee bundle example** so the flow is easy to understand. ☕

🐺 Wolfpack — What Merchants See (Simple Flow)

This explains **how a merchant would actually use Wolfpack** from start to finish.

Example store: **Brewly Coffee**

They sell:

- Coffee Beans — $25
- Coffee Mug — $15
- Coffee Grinder — $35

They want to sell a bundle called:

Home Barista Starter Kit

Bundle price:

$49

1️⃣ Merchant Opens Wolfpack

Inside the **Wolfpack app dashboard**, the merchant clicks:

Create Bundle

They see a simple bundle builder.

Example fields:

Bundle Name

Home Barista Starter Kit

Bundle Price

$49

Products Included

Merchant selects:

- Coffee Beans
- Coffee Mug
- Coffee Grinder

Wolfpack shows a preview:

Home Barista Starter Kit

Includes:
✓ Coffee Beans
✓ Coffee Mug
✓ Coffee Grinder

Bundle Price: $49
Original Value: $75

Merchant clicks:

Create Bundle

---

2 Bundle Appears in Shopify

After creation, the merchant opens their **Shopify Products page**.

They now see a new product:

Home Barista Starter Kit

Just like any other product.

It has:

Field	Value
Title	Home Barista Starter Kit
Price	$49
Product Type	Bundle
URL	`/products/home-barista-starter-kit`

From the merchant's perspective:

👉 It looks exactly like a normal product.

This is the key difference compared to most bundle apps.

3️⃣ Merchant Publishes the Bundle

Inside Shopify, the merchant chooses where the bundle should appear.

They can enable:

✓ Online Store
✓ Shop App
✓ Google channel
✓ Meta (Facebook / Instagram)
✓ TikTok

Once enabled, Shopify automatically sends the bundle to those platforms.

The merchant does **not need to configure anything else in Wolfpack.**

4️⃣ Bundle Appears in Ad Catalogs

Because the bundle is now a **real product**, it automatically appears inside ad catalogs.

Example:

Google Merchant Center

Product appears like:

Home Barista Starter Kit
Price: $49
Availability: In Stock
Link:
store.com/products/home-barista-starter-kit

Meta Catalog

Same bundle appears in:

Facebook / Instagram product catalog.

TikTok Catalog

Same bundle appears in:

TikTok Ads catalog.

The merchant can now **run ads for the bundle directly.**

---

5 Merchant Runs Ads for the Bundle

Example Google ad:

Home Barista Starter Kit
Beans + Grinder + Mug
Only $49
Shop Now

Customer sees the ad in **Google Shopping**.

Customer clicks the ad.

They land on:

store.com/products/home-barista-starter-kit

The bundle page shows:

Home Barista Starter Kit

Includes:

- Coffee Beans
- Coffee Mug
- Coffee Grinder

Price:

$49

Customer clicks:

Add to Cart

Then completes checkout.

6️⃣ Wolfpack Tracks Where Sales Came From

When the customer clicked the ad, the link included campaign information.

Example:

utm_source=google
utm_campaign=coffee_bundle_ads

Wolfpack records this automatically.

When the order is completed, Wolfpack connects:

Bundle sold → Ad campaign.

7️⃣ Merchant Sees Bundle Performance

Inside **Wolfpack Analytics**, the merchant sees a dashboard.

Example:

Bundle Revenue by Platform

Platform	Revenue
Google	$3,200
Meta	$1,500
TikTok	$700

Bundle Revenue by Campaign

Campaign	Revenue
coffee_bundle_ads	$2,000
holiday_bundle	$1,400

The merchant now understands:

- which bundles sell best
- which ads drive bundle sales
- which campaigns are profitable

8️⃣ Special Case: Campaign-Only Bundles

Sometimes merchants create bundles **only for ads**.

Example:

TikTok Coffee Creator Bundle

This bundle:

- does not appear in the store catalog
- is only used in ads

Example ad:

TikTok Coffee Creator Bundle
Limited Creator Deal
Only $39

Customer clicks the ad and lands directly on:

/products/tiktok-coffee-bundle

They can purchase the bundle normally.

🧾 Final Merchant Experience

From a merchant's perspective, Wolfpack allows them to:

1️⃣ Create bundle products easily
2️⃣ Sell bundles like normal products
3️⃣ Run ads for bundles on

- Google
- Facebook / Instagram
- TikTok

4️⃣ Track which campaigns sell bundles

✅ The merchant does **not see technical systems** like:

- APIs
- feed syncing
- attribution pipelines

They simply see:

Create bundle → publish → run ads → see results
